

HEALTHCARE INTELLIGENCE, REIMAGINED

AI Health Dashboard

A unified, AI-powered view of patient vitals, trends, and risk — built to help care teams act sooner and patients understand more.

THE PROBLEM

Health data is everywhere — and nowhere useful

Fragmented sources

Vitals, labs, wearables, and notes live in separate systems that rarely talk to each other.

Manual review

Clinicians spend hours reconciling charts instead of focusing on judgment and care.

Delayed alerts

Warning signs surface late because no one is watching every trend line, every hour.

Result: preventable readmissions, alert fatigue, and clinicians who trust their gut more than their software.

THE SOLUTION

One dashboard. Every signal. Real-time clarity.

The AI Health Dashboard pulls vitals, labs, wearable streams, and clinical notes into one continuously-updated view, then layers AI on top to flag what matters.

Unified ingestion

EHR, wearables, labs, and remote monitors sync automatically into one patient timeline.

AI-driven triage

Models score risk continuously and surface the patients who need attention first.

Trend intelligence

Every metric shown against its own baseline, not just a raw number in isolation.

Anywhere access

Same live dashboard on desktop, tablet, or phone for rounds, home visits, or on call.

KEY FEATURES

Built for how care teams actually work

Live vitals

Continuous streams for heart rate, BP, SpO2, and respiration with auto-refresh.

Predictive risk scores

Early-warning models flag deterioration hours before traditional thresholds trip.

Smart alerts

Threshold and trend-based alerts tuned per patient to cut noise, not signal.

Wearable integration

Steps, sleep, and activity from consumer devices folded into the clinical picture.

Care team view

Role-based dashboards so nurses, physicians, and admins see what's relevant to them.

Privacy by design

End-to-end encryption and granular access controls aligned to HIPAA.

PRODUCT PREVIEW

What the care team sees

Patient: J. Alvarez • Room 214 • Risk score: Moderate

Heart Rate

78 bpm

SpO2

96 %

BP

128/82 mmHg

Sleep

6.2 hrs

Heart rate — last 12 hours

AI Insight

SpO2 trending down 3% over 2 hrs. Pattern matches early respiratory distress — recommend recheck.

What the AI is actually doing

Predictive analytics

Gradient-boosted and sequence models trained on longitudinal vitals forecast deterioration risk 6–12 hours ahead.

Anomaly detection

Per-patient baselines mean the system flags what's unusual for this person — not a generic population threshold.

Note summarization

Clinical notes are condensed into a running summary so history is scannable in seconds, not pages.

Natural-language query

Ask "show me why this score changed" and get a plain-language, evidence-linked answer.

HOW IT FITS TOGETHER

From raw signal to bedside decision

Every stage is auditable — clinicians can trace any alert back to the raw data and the model logic behind it.

HIPAA-aligned

SOC 2 controls

Role-based access

Full audit trail

EARLY IMPACT

Signal caught earlier, care delivered faster

38%

fewer missed deterioration
events in pilot units

2.4×

faster time from warning
sign to clinician review

27%

reduction in low-value alerts
flagged as noise

91%

of nurses said the
dashboard changed how
they prioritize rounds

Based on a 12-week pilot across 3 med-surg units, n=214 patients. Full methodology available on request.

Let's bring every signal into one view

Next step: a 30-minute walkthrough with your clinical and IT leads to map the dashboard to your existing data sources.
